Tagline:

Where traditional automation fails, Catalytic scales. Accelerate the pace of innovation with the easiest way to build end-to-end smart workflows.

Overview:

Catalytic is the next generation of digital process automation, providing a uniform platform for rapidly creating process-oriented applications and smart workflows. With Catalytic's no-code framework, anyone can build enterprise-grade automated processes that connect systems, data and people. The result is a faster, leaner and fully digitised business that can execute higher volumes of work with less time, cost and risk.

Case study:

Global manufacturing company Bosch uses Catalytic for a number of supply chain processes - all previously done with manual employee work.

Data quality: Bosch uses Catalytic for a quality check process to validate entries in its SRM. After buyers manually enter data, Catalytic instantly checks it against a predefined list of potential errors, and routes deviations to the appropriate buyer.

Compliance: To ensure compliance with the Restriction of Hazardous Substances Directive, Bosch uses Catalytic to automate the distribution of 3,600 reports tailored to each supplier, and track the completion of supplier tasks in response to the reports. This saves the company 200 days of effort.

Contracts: Catalytic scans over 69,000 contracts using OCR to automatically extract key terms required for approval. When needed, exceptions are routed to an employee. This process saves Bosch 1,500 days of effort. With many similar workflows built, Catalytic has been a driving force within Bosch's digital transformation journey. In just 18 months, Catalytic-powered solutions automated more than 5 million tasks across 31 countries, saving Bosch 35,000+ hours of effort.
